University of Aarhus

# Outline of Presentation

- The Dragon Project
  - Settings
  - Major Challenges
- The Process
  - Experimentation
  - Tools
  - Going Out
  - Actual Work
  - Object Modelling
  - Multiple Competencies
- Lessons Learned

# Settings

- **Duration**
  - March 1997 - July 1998 - ...
  - Prototype appraised and approved by the company's highest executive body in May and 5 major iterations
  - Prototype major requirements specification for production system
- **Partners**
  - A globally distributed shipping company
  - The DEVISE research group at Aarhus university
    - Participatory design
    - Object-orientation
- **Development group**
  - Ethnography, participatory design, object-orientation, usability
- **Objectives**
  - Business: prototype for a global booking system
  - Research: experiences with tools, techniques and approaches developed by DEVISE

# Major Challenges

The global booking system should

- Replace several old systems
  - Currently 50+ individual systems
  - Several local variants of systems
- Coordinate distributed work
  - Customer service should be world wide and coordinated
- Respect local needs
  - The process of booking in Singapore is *not* the process of booking in Hamburg

# The Process

Concerns

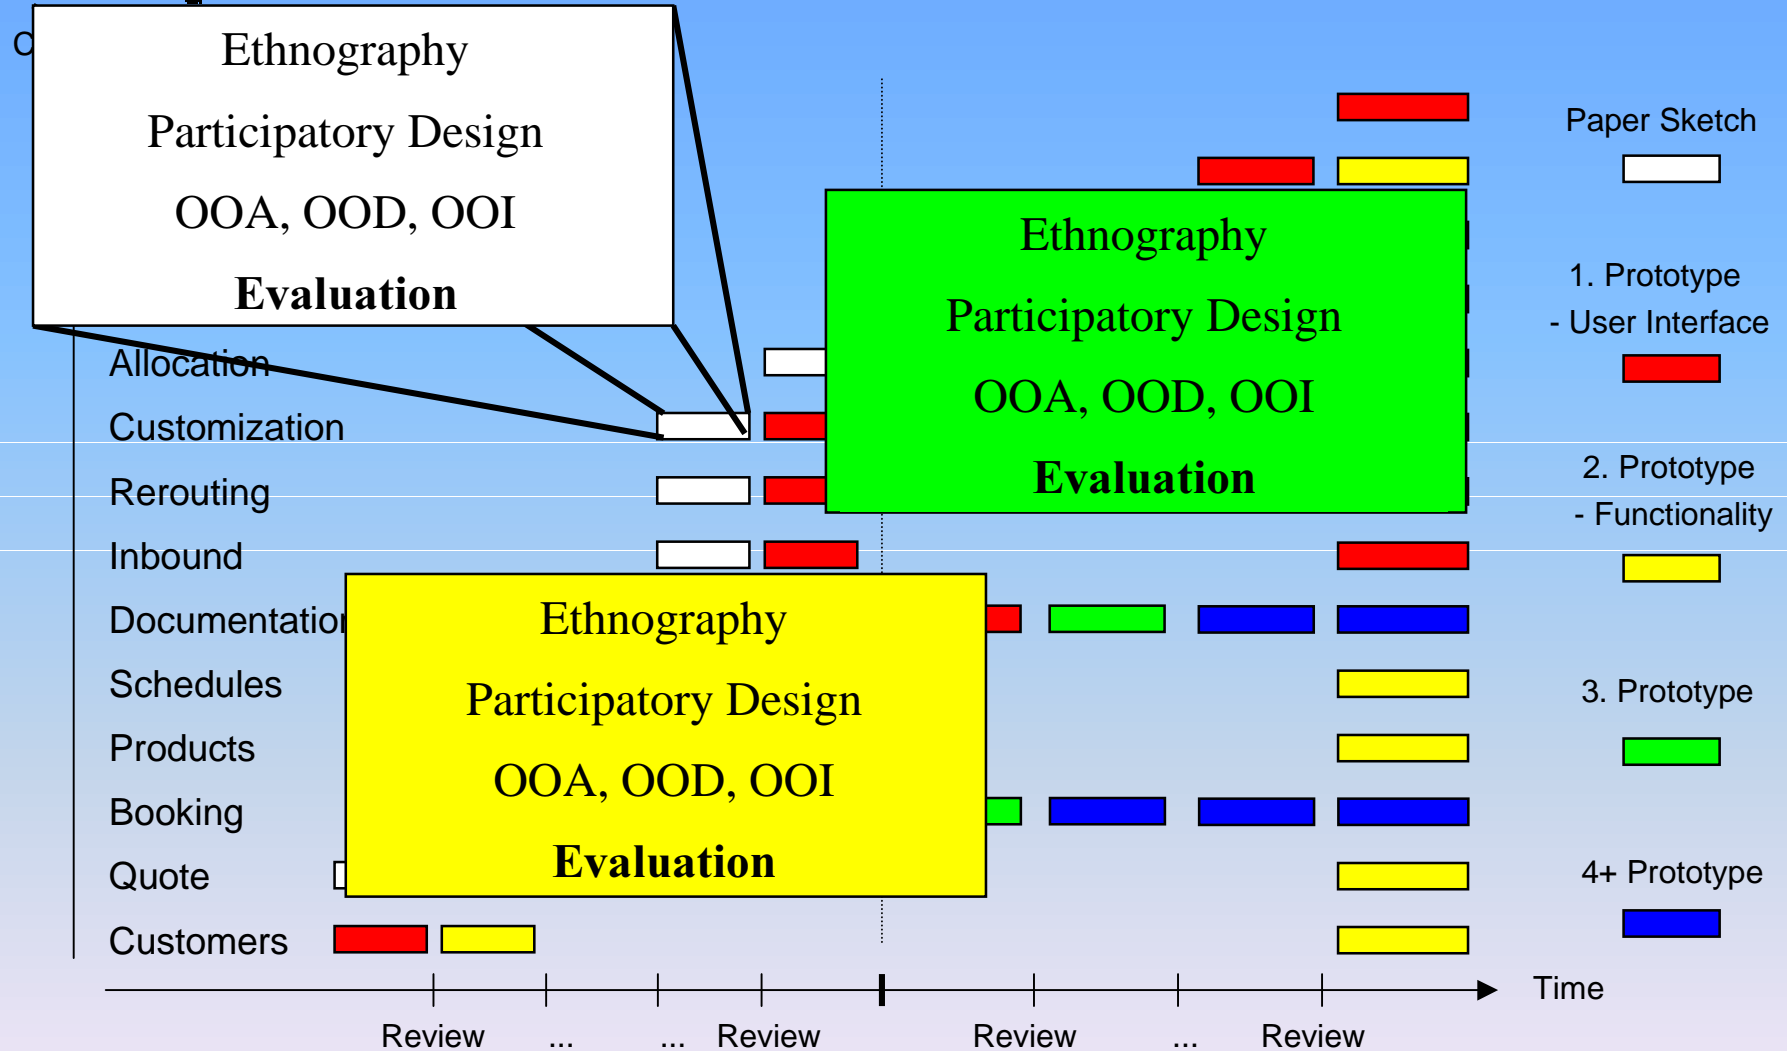

July 17, 1998

The M.A.D. Experience

Klaus Marius Hansen

# The Process

July 17, 1998

The M.A.D. Experience

Klaus Marius Hansen

# Experimentation

- Is *performance* of development in *active collaboration* with users
- Concretises visions of the future through e.g. Prototype
- Radical parallelism yet evolution towards product system
  - Code from day one - still analysis
  - Need for flexibility and robustness of prototype
  - Need for tool-support

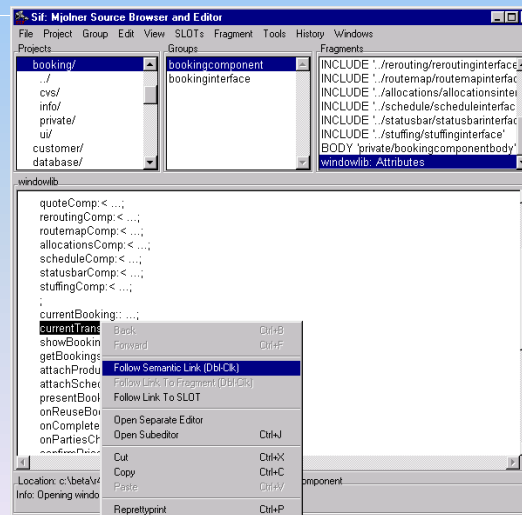

# Tools

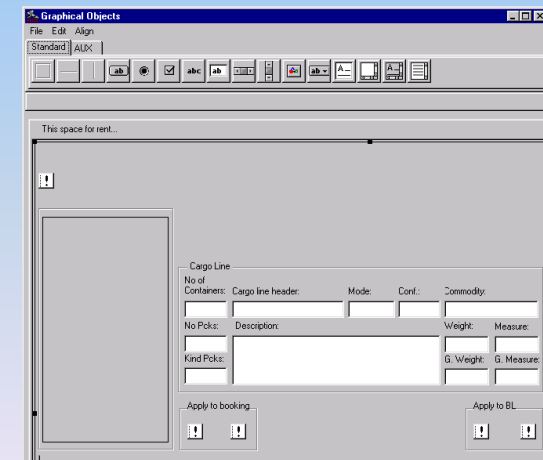

- Support for many iterations over short time
- Reengineering capabilities crucial
- The BETA language and the Mjølner System:
  - CASE tool
    - UML notation, incremental code generation
    - Model changes mostly in code editor, diagrams reengineered
  - Code editor
    - abstract overview, semantic links
    - crucial in restructuring the prototype
  - GUI builder
    - interface created from start, used for discussions also
    - coordinating between OO-developers and participatory designer

July 17, 1998

The M.A.D. Experience

Klaus Marius Hansen

# Going Out

## ***Thursday:***

4 developers and 2 business representatives arrive in Singapore

## ***Friday:***

*(Morning)* presentation of the prototype to some 20 people

*(Afternoon)* developers join various people doing usual work

## ***Saturday:***

*(Morning)* workshop with 4 people centred on booking

*(Afternoon)* lessons learned & implementation/redesign decisions

## ***Monday:***

*Ethnographer* focuses on allocation and pricing

*Participatory designer* makes hands-on session with 3 users

*OO-developers* implement proposed changes

## ***Tuesday:***

Presentation of changes & details on next issues on agenda for prototype

## ***Wednesday:***

4 developers and 2 business representatives arrive in Malaysia

# Coming Home

- Actual implementation of two major components started
- Developers experienced actual work in Asia
- Asia experienced the prototype

# Actual Work

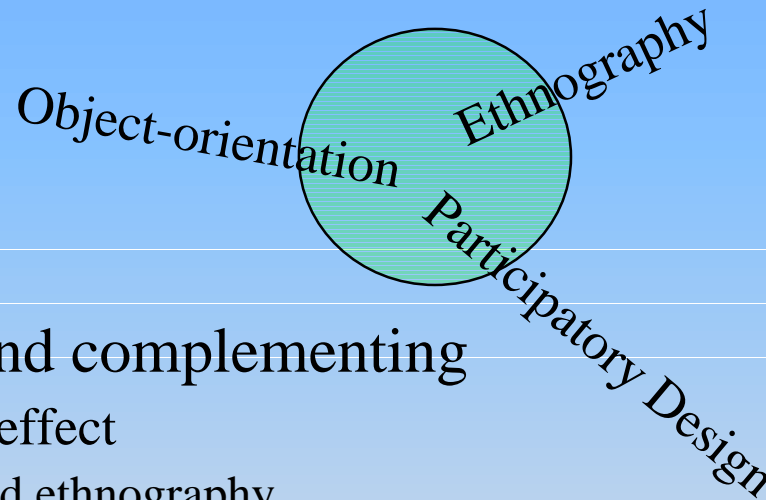

- System design *is* work design
  - System design must be based on an understanding of actual work
  - Ethnography, workshops, evaluation of prototype used to make actual work in details visible to developers
  - Ethnographer is not “proxy user”
- Bring users into development *and* developers to users
- Effective design bridges between current and future work
  - Subject of analysis, springboard for design and goal of implementation
- Prototypes, mock-ups, scenarios, object modelling complement understanding through ethnography

# Multiple Competencies

- Use of diverse competencies

- Interacting and complementing
  - Synergetic effect
    - OOA and ethnography
    - Participatory design and ethnography
    - OOD and participatory design
  - No strict separation
  - Actual work and prototype as common frame of reference

# Lessons Learned

- *OO-analysis is more than finding nouns and verbs*
  - Analysis is directed towards understanding of current work
  - Ethnography and participatory design provides a concrete understanding of actual work
  - Developers need concrete experiences from actual work
- *OO-design is more than filling in details in the object-oriented analysis model*
  - Participatory design provides concrete design visions through experimentation
  - Design needs to find “best matches” between current and future work
- *OO-implementation is more than translating design models into code*
  - Starts early - design visions *will* change
  - Implementation is the implementation of emerging design visions
- *Principles does not apply to all problems in all situations*
  - Approach applied successfully in the concrete settings: complex human work, high uncertainty, large and geographically distributed organisation

# Pointers - So Far ...

The DEVISE research group at Aarhus University

*<http://www.daimi.aau.dk/DEVISE/>*

Crabtree, A., Mogensen, P. *The Relevance of Specifics and the Specifics of Relevance*, in preparation

Crabtree, A. *Ethnography in Participatory Design*, accepted for PDC'98

Christensen, M., Damm, C.H., Hansen, K.H., Sandvad, E., Thomsen, M. *Architectures of Prototypes and Architectural Prototyping - The Dragon Experience*, accepted for NWPER'98

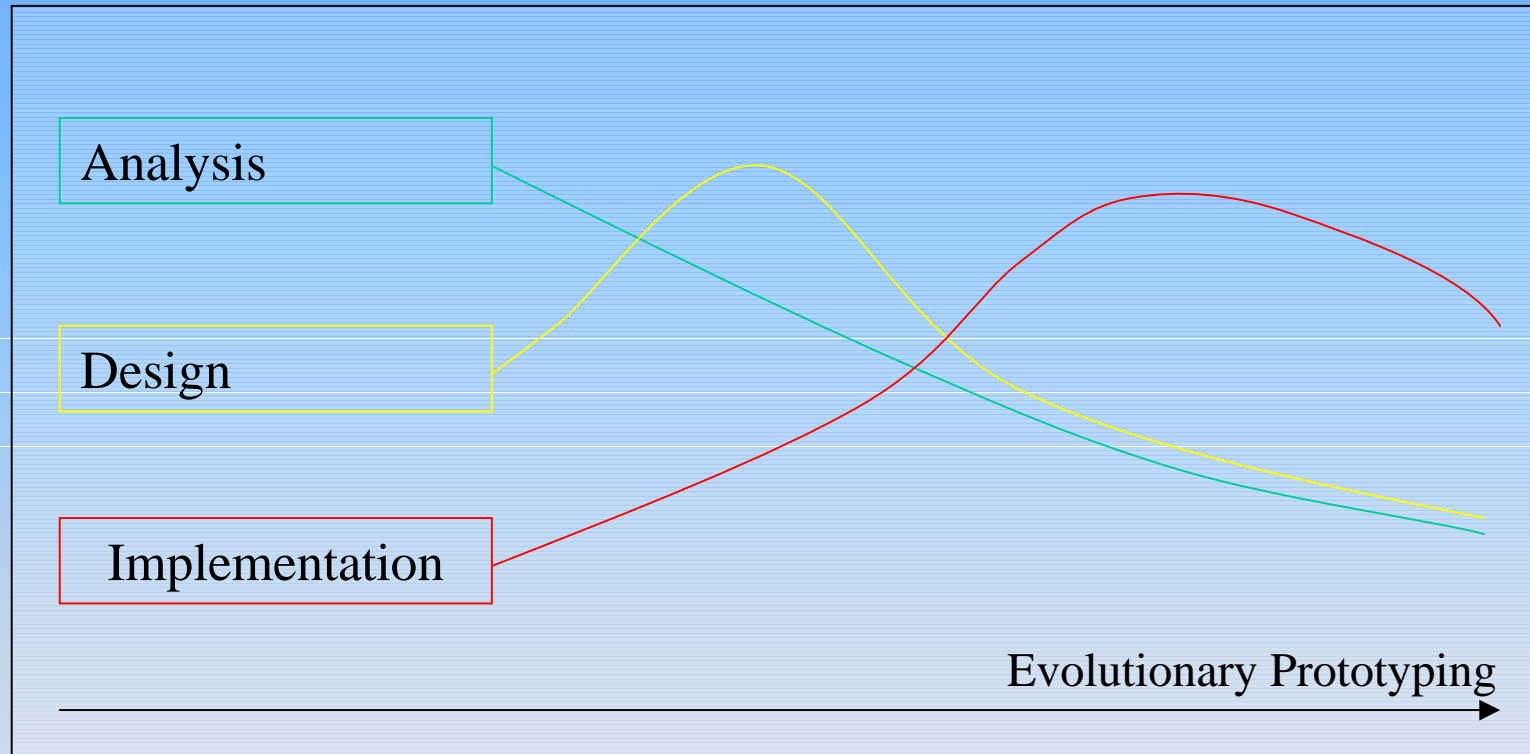

Funded by the Danish national Centre for IT-research

*<http://www.cit.dk>*

# Concerns

Movement of concerns of evolutionary prototyping implementation

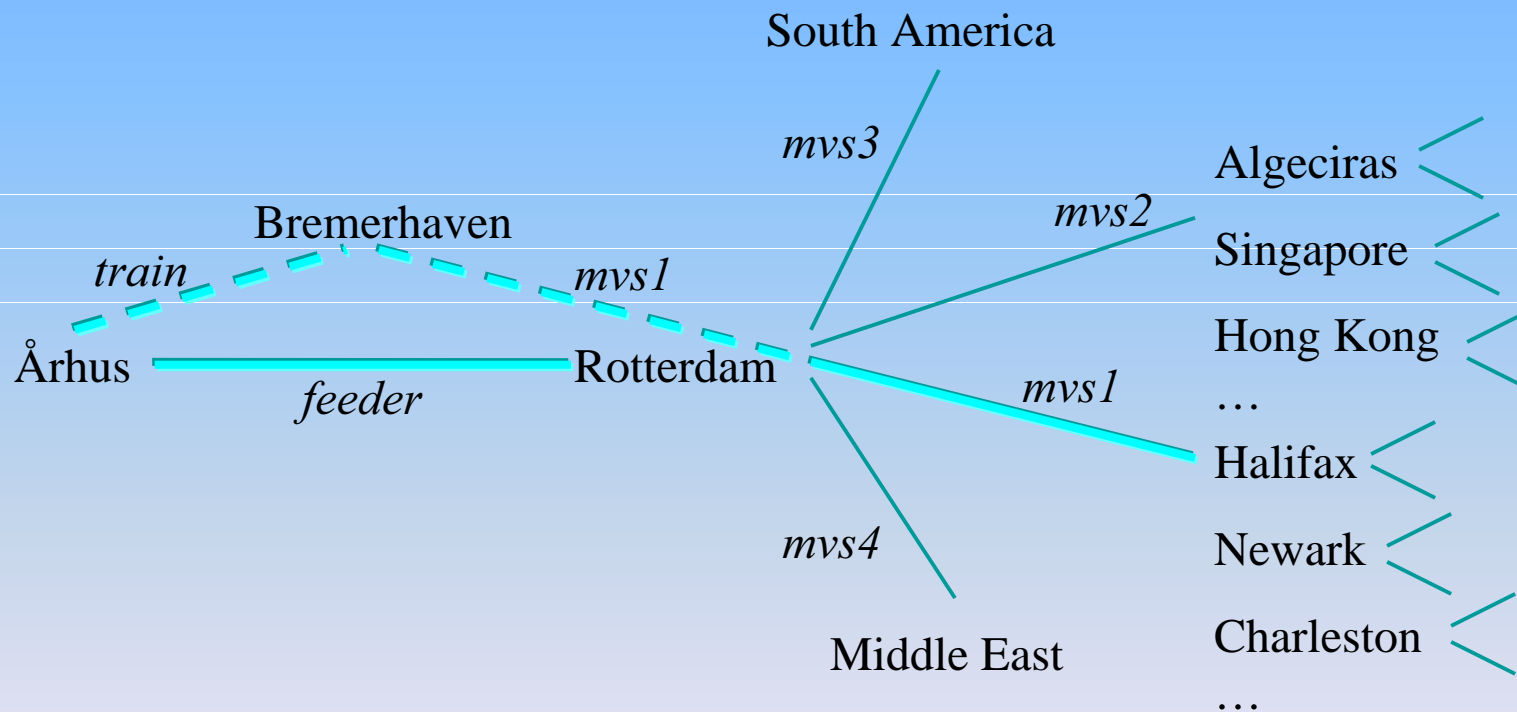

# Work Instances

- Real world instance of actual work
  - E.g. “rerouting”
  - Ethnographer collect examples, participatory designer comes up with visions, developers reiterates
  - Does not focus on how to perform the work in a final system
- Used and reproduced within development group, presentations, workshops, usability studies, ...
- Does not capture all possible problems - not a final design solution
  - Compact and understandable
  - Good starting point

# The Bremerhaven Work Instance

# “Pipe Smoking, Anarchistic Researchers”?

## - Managing Development

- Not necessarily a vice or virtue
- Workshops
  - Presentations: 150+ staff from over 20 countries
  - Workshops (1-3 days): 40+ staff from 10 countries
  - Continuous workshops: 6 staff from 5 countries
- Reviews
  - On average every 2 weeks
  - Formal, informal, business representatives, executive body
  - Major reviews: March ‘97, April ‘97, May ‘97, June ‘97, December ‘97, March ‘98
- Documentation
  - Documenting OO, participatory design, ethnography
  - Documenting interaction - representation of work instances
  - Documenting decisions
